

MONITORING AND TARGETING IS BASIS FOR SUCCESSFUL ENERGY RETROFITTING

Even by existing utility meters you can assess the whole building energy performance:

- read the meters regularly (min. once a month); it takes just some minutes
- calculate the consumption figures; use simple tools (e.g. www.vtt.fi/kulu) if no more advanced system is available
- compare the figures to the target values and to the similar previous months and years!
- compare the figures to the similar buildings; benchmarking can show the saving potential!
